- 02 Task Vignettes (User Activity Flow)
- 03 Technical Flow
- 04 Final (Self) Assessments

OVERVIEW

The **Multimodal Hub Studio**

*The **Multimodal Hub Studio** is a website and resource hub, featuring a wealth of resources and information for college instructors who wish to design and implement multimodal projects in English communication courses.*

The Problem: English communication instructors want to assign multimodal projects but lack sufficient model exemplars, tools, and ready-made scaffolding materials that are really multimodal—not multimodal in name only.

The Solution: A "making space" not a static resource list where English communication instructors browse real student work, get teaching materials, and build an assignment step-by-step, learn more about multimodal projects design, and event assessment of these projects.

External Mechanisms: Media embeds for audio/video (existing student artifacts), a rules-based assignment generator; feature texts (words), visuals (video, images, colors, layout, design elements), sound (music, sound effects, audio clips), and careful organization of elements in digital space (spatial), gestures (emojis, GIFs).

Ideal GUI: The **Multimodal Hub Studio** will use a web front end, specifically, Streamlit, so instructors can browse the gallery and toolkit visually and complete other user tasks.

TIMELINE

TBD. End of the Fall 2026 semester?

TARGET AUDIENCE

**College English Communication
Instructors**

**Technical and Professional
Communication Students**

English Composition Students

OBJECTIVES

OBJECTIVE 01

Learn about multimodal resources and multimodality

OBJECTIVE 02

Run the assignment generator from the command line

OBJECTIVE 03

Prompt for modality, purpose, audience, tools → print a generated assignment sheet.

OBJECTIVE 04

Use a web front end, specifically, Streamlit, so instructors can browse the Gallery and Toolkit visually.

Task Vignettes

User Activity Flow for Visitors to the Multimodal Hub Studio Website

Browse the Project Gallery

An instructor searches the project gallery to find a multimodal project example (the could be a video essay or comic), opens it, reads a rhetorical analysis of it, and downloads an assignment sheet related to the project of their choice.

Build an Assignment

An instructor picks a multimodal project modality, decide it rhetorical purpose, audience, tool set, and the generator produces an assignment sheet, rubric, and scaffolding plan

Try the Color Playground

An instructor experiments with Color Theory Sandbox, adjusting a palette and seeing contrast ratios update

Task Vignettes (Continued)

User Activity Flow for Visitors to the Multimodal Hub Studio Website

Pedagogy Knowledge Base

An instructor searches through the pedagogy knowledge base and finds a topic of interest that connects to multimodality and multimodal projects, reads it, and learns about its connection to instruction and visual communication

Tool Library

An instructor finds a multimodal project tool from the Tool Library, learns about it, and sees examples of how it is used to support multimodal projects

Multimodal Project Teaching Toolkit

An instructor searches the Multimodal Project Teaching Toolkit for various ideas to plan, teach, scaffold, multimodal projects.

Technical Flow

Final (Self Assessment)

01

The biggest and most unexpected change I have had to make from my sketch is applying design thinking to this project. I'm learning to slow down. The *ideal user* I had in my head is different from the *user out there in the real world*! I realize that I have to break down my plans and be really organize about this project, including the assets that I will use. Keeping this project narrow without getting carried away with new ideas (this happens to me a lot) is also a challenge.

02

I would say that I am 60 % confident. Thanks to AI assisted coding (for brainstorming), Python 1 course, my writing skills, and my knowledge of prompt engineering, I have many of my assets for the website such as pictures, videos, audio sounds, text, GIFs, that I will use for the website on my USB flash drive. This gives me a lot of confidence. But I know that I am not great at coding, and I could mess things up. I might be underestimating the workload of coding and implementing all my specs so far, especially the gap on the website that is pedagogical vs what a CLI-based prototype can actually demonstrate this semester.

03

I think the biggest potential problem I need to resolve is translating most of the specs into codes, putting them on Github, and working with the limited time that I have. I am also thinking the generator's rule logic would be a challenge that I need to overcome. I also have to teach, grade, and work on other assignments, and I realize that I can sometimes drop the ball by turning in work late. I am also a perfectionist, and I want my work to be excellent.

04

As I see things, I believe the part where I would need the most help with is with coding and integrating my sketch, which is on Canva, into Streamlit. I am not too familiar with Streamlit but I hope your guidance here would make this lighter for me to execute. I think structuring nested lookup logic cleanly and figuring out how the media will be embedded on the site will also be an area that I need some guidance.
